Geophysics is only one tool that can be applied to a groundwater investigation and its success must rely on the careful interpretation and integration of the results with the other geologic and hydrogeologic data for the site. Only then will the geophysics be a success. Geophysics is typically used in one of two ways.

Applied Geophysics For Groundwater Studies

Applied Geophysics For Groundwater Studies In the past, geophysics has either been used as a tool for groundwater resource mapping or as tool for groundwater character discrimination. For groundwater resource mapping it is not the groundwater its self that is the target of the geophysics rather it is the geological situation in which the water exists. Applied Geophysics For Groundwater Studies

Introduction In many developed and developing countries there is not only a heavy reliance on ground water as a primary drinking supply but also as a supply of water for both agriculture and industrial use. The reliance on groundwater is such that it is necessary to ensure that there are significant quantities of water and that the water is of a high quality. The use of geophysics for both ...
