The questionnaire was also designed to focus on the following three elements of hospital IT infrastructure: (1) accessibility to the internet and other information sources, including wired/wireless LAN availability; (2) access to paid medical evidence databases in English and Japanese; and (3) medical library and intranet usability, such as the availability of a well-organised intranet interface, number of full-time medical librarians and activities for improving the medical library.

Consumer health websites have garnered considerable media attention, but only begin to scratch the surface of the more pervasive transformations the Internet could bring to health and health care. Networking Health examines ways in which the Internet may become a routine part of health care delivery and payment, public health, health education, and biomedical research. Building upon a series of site visits, this book: Weighs the role of the Internet versus private networks in uses ranging from the transfer of medical images to providing video-based medical consultations at a distance. Reviews technical challenges in the areas of quality of service, security, reliability, and access, and looks at the potential utility of the next generation of online technologies. Discusses ways health care

organizations can use the Internet to support their strategic interests and explores barriers to a broader deployment of the Internet. Recommends steps that private and public sector entities can take to enhance the capabilities of the Internet for health purposes and to prepare health care organizations to adopt new Internet-based applications.

This book constitutes the refereed proceedings of the 7th International Conference on Information Technology in Bio- and Medical Informatics, ITBAM 2016, held in Porto, Portugal, in September 2016, in conjunction with DEXA 2016. The 9 revised long papers presented together with 11 poster papers were carefully reviewed and selected from 26 submissions. The papers address the following topics: biomedical data analysis and warehousing; information technologies in brain science; and social networks and process analysis in biomedicine.

The Internet has now become an integral part of everyday life for hundreds of millions of people around the world. The uses of the Internet have augmented commerce, communication, education, governance, entertainment, health care, etc. E-mail has become an indispensable part of life; the Web has become an indispensable source of information on just about everything; people now use government Websites to receive instructions and information, and to do paperwork with the government; many major online businesses have been created, such as Amazon, eBay, Google, Travelocity, eTrade, etc. However, the uses of the Internet have also had serious negative effects, - cluding spam, the spreading of viruses and worms, spyware, phishing, hacking, online fraud, invasions of privacy, etc. Viruses and worms often bring down tens of millions of computers around the world; many people get duped into furnishing their personal identifications, and bank and insurance account information, etc. ; hackers break into government and corporation computers to steal critical data; unsubstantiated rumors about individuals or organizations spread like wildfire on the Internet, etc. Further, the uses of the Internet are creating new paradigms in areas such as copyright, governance, etc. The widespread use of peer-to-peer file sharing systems, started by Napster, is forcing a reassessment of the value of holding copyright on digital media. Internet postings by vocal citizens to the Web sites of the news media, government offices, and elected government officials are impacting government policies and swaying the opinions of other citizens. The aim of the International Conference on Human.

The landmark 2010 Patient Protection and Affordable Care Act (ACA), "Obamacare," was the largest healthcare policy innovation in the United States in 50 years, and it has generated strong opinions and debate across public, political, and policy arenas. Examining the innovation of the ACA as a health policy experiment, *The Affordable Care Act as a National Experiment* was published by Springer in 2014.

Now, six years later, following an election year in which the ACA remained hotly debated, this second edition further examines the history, lessons, and impact of this ground-breaking legislation. Written by national healthcare policy leaders involved in the ACAs creation and implementation, this book addresses questions around patient protection under the ACA, delves into Medicaid expansion and insurance reform, assesses the Supreme Court review of the ACA, and sheds light on the related social determinants of health. It also provides informative stories of the uninsured. It discusses the stabilization of the ACA, and concludes with a summary of potential next steps and the push for universal healthcare. This second edition further underscores that to improve access to medical care and the publics health, we must innovate and to innovate is to experiment. It makes clear that the ACA is a "translational medical research" experiment an experiment aimed at translating best medical knowledge into improvements in health. And it shows that, like any medical experiment, its results will point to needed next steps. We hope this text becomes an essential resource for healthcare providers, policy makers, and academics.

A wave of new health care innovation and growing demand for health care, coupled with uncertain productivity improvements, could severely challenge efforts to control future health care costs. A committee of the National Research Council and the Institute of Medicine organized a conference to examine key health care trends and their impact on medical innovation. The conference addressed the following question: In an environment of renewed concern about rising health care costs, where can public policy stimulate or remove disincentives to the development, adoption and diffusion of high-value innovation in diagnostics, therapeutics, and devices?

managing in population health. A wealth of updated case studies of organizations experiencing management-related system challenges.

The Children's Health Insurance Program was crafted in a period of intense partisan and ideological controversy over health care entitlements to provide "creditable coverage" for American children below 200 percent of the Federal Poverty Level. This objective was widely supported, though achieved only by a compromise between the structural alternatives of a block grant, similar to the Maternal and Child Health Block Grant or an entitlement resembling Medicaid. According to David G. Smith, the CHIP compromise has been a successful experiment that far exceeded expectations, both in identifying and enrolling "targeted low-income children" and in earning political capital. He argues that beyond this core mission, the reauthorization of CHIPRA (Children's Health Insurance Program Reauthorization Act of 2009) invites a larger mission: going beyond enrollment of children to include assuring access, improving quality, and containing costs of health care for them. Extending this thrust, the author notes that CHIP could be used to establish children's health as a niche—much like care for the elderly—within the larger scheme of health care insurance for all. Several areas of successful performance needed for the program to be adjudged a success as well as its limitations are discussed in the book. These areas include initial implementation, enrolling kids, federal-state relations, and the uses and misuses of waivers to modify the program. A description of changes made by the CHIPRA reauthorization and the new Patient Protection Affordable Care Act (PPACA) is also included. This is followed by a consideration of lessons learned from CHIP's evolution and recommendations for future development. In short, this is a valuable and readable account for those interested in the current and future trends of health care for the young.

In the last few years, the protection of computerised medical records, and of other personal health information, has become the subject of both technical research and political dispute in a number of countries. In Britain, the issue arose initially as an argument between the British Medical Association and the Department of Health over whether encryption should be used in a new medical network. In Germany, the focus was the issue to all patients of a smartcard to hold insurance details and facilitate payment; while in the USA, the debate has been whether federal law should preempt state regulation of computerised medical records, and if so, what technical and legal protection should be afforded the patient. Whatever the origin and evolution of this debate in specific countries, it has become clear that policy and technical matters are closely intertwined. What does 'computer security' mean in the medical context? What are we trying to do? What are the threats that we are trying to forestall? What costs might reasonably be incurred? To what extent is the existing technology - largely developed to

meet military and banking requirements - of use? And perhaps hardest of all, what is the right balance between technical and legal controls? As the debate spread, it became clear that there was little serious contact between the people who could state the requirements - clinical professionals, medical ethicists and patients - and the people who could explore how to meet

Comprising 102 papers presented by researchers from all over the world, the proceedings of this workshop contain current information about a variety of structural health monitoring technologies, as well as their current and potential applications in various fields. Emphasis is placed on those technologies that are promising for future applications in industry and government and the infrastructures that are needed to support such technological development. The content of the workshop is divided into keynote presentations (ten altogether), aerospace applications, general applications, civil applications, integration and systems, sensors, and signal processing and diagnostic methods. Includes the editor's summary report on the results of the panel discussions and presentations from the First International Workshop on Structural Health Monitoring held at Stanford U. in September 1997.
