Underage Drinking – Alcohol and Drug Awareness of Monroe

Youth drink within the context of a society in which alcohol use is normative behavior and images about alcohol are pervasive. They usually obtain alcohol—either directly or indirectly—from adults. Efforts to reduce underage drinking, therefore, need to focus on adults and must engage the society at large.

Alcohol use by young people is extremely dangerous - both to themselves and society at large. Underage alcohol use is associated with traffic fatalities, violence, unsafe sex, suicide, educational failure, and other problem behaviors that diminish the prospects of future success, as well as health risks and the earlier teens start drinking, the greater the danger. Despite these serious concerns, the media continues to make drinking look attractive to youth, and it remains possible and even easy for teenagers to get access to alcohol. Why is this dangerous behavior so pervasive? What can be done to prevent it? What will work and who is responsible for making sure it happens? Reducing Underage Drinking addresses these questions and proposes a new way to combat underage alcohol use. It explores the ways in which may different individuals and groups contribute to the problem and how they can be enlisted to prevent it. Reducing Underage Drinking will serve as both a game plan and a call to arms for anyone with an investment in youth health and safety.

work and who is responsible for making sure it happens? Reducing Underage Drinking addresses these questions and proposes a new way to combat underage alcohol use. It explores the ways in which may different individuals and groups contribute to the problem and how they can be enlisted to prevent it. Reducing Underage Drinking will serve as both a game plan and a call to arms for anyone with an investment in youth health and safety.

Alcohol is the most widely used substance of abuse among America's youth. A higher percentage of young people between the ages of 12 and 20 use alcohol than use tobacco or illicit drugs. The physical consequences of underage alcohol use range from medical problems to death by alcohol poisoning, and alcohol plays a significant role in risky sexual behavior, physical and sexual assaults, various types of injuries, and suicide. Underage drinking also creates secondhand effects for others, drinkers and nondrinkers alike, including car crashes from drunk driving, that put every child at risk. Underage alcohol consumption is a major societal problem with enormous health and safety consequences and will demand the Nation's attention and committed efforts to solve. For the most part, parents and other adults underestimate the number of adolescents who use alcohol. They underestimate how early drinking begins, the amount of alcohol adolescents consume, the many risks that alcohol consumption creates for adolescents, and the nature and extent of the consequences to both drinkers and nondrinkers. Too often, parents are inclined to believe, "Not my child." Yet, by age 15, approximately one half of America's boys and girls have had a whole drink of alcohol, not just a few sips, and the highest prevalence of alcohol dependence in any age group is among people ages 18 to 20. This Surgeon General's Call to

File Type PDF Reducing Underage Drinking A Collective Responsibility

Action To Prevent and Reduce Underage Drinking was issued to focus national attention on this enduring problem and on new, disturbing research which indicates that the developing adolescent brain may be particularly susceptible to long term negative consequences from alcohol use. Recent studies show that alcohol consumption has the potential to trigger long term biological changes that may have detrimental effects on the developing adolescent brain, including neurocognitive impairment. Fortunately, the latest research also offers hopeful new possibilities for prevention and intervention by furthering our understanding of underage alcohol use as a developmental phenomenon—as a behavior directly related to maturational processes in adolescence. New research explains why adolescents use alcohol differently from adults, why they react uniquely to it, and why alcohol can pose such a powerful attraction to adolescents, with unpredictable and potentially devastating outcomes. Emerging research also makes it clear that an adolescent's decision to use alcohol is influenced by multiple factors. These factors include normal maturational changes that all adolescents experience; genetic, psychological, and social factors specific to each adolescent; and the various social and cultural environments that surround adolescents, including their families, schools, and communities. These factors—some of which protect adolescents from alcohol use and some of which put them at risk— change during the course of adolescence. Because environmental factors play such a significant role, responsibility for the prevention and reduction of underage drinking extends beyond the parents of adolescents, their schools, and communities. The process of solving the public health problem of underage alcohol use begins with an examination of our own attitudes toward underage drinking—and our recognition of the seriousness of its consequences for adolescents, their families, and society as a whole. Adolescent alcohol use is not an acceptable rite of passage but a serious threat to adolescent development and health, as the statistics related to adolescent impairment, injury, and death attest. A significant point of the Call to Action is

File Type PDF Reducing Underage Drinking A Collective Responsibility

this: Underage alcohol use is not inevitable, and schools, parents, and other adults are not powerless to stop it. The latest research demonstrates a compelling need to address alcohol use early, continuously, and in the context of human development using a systematic approach that spans childhood through adolescence into adulthood.

"This resource reflects input gathered during a meeting convened in 2004 to review the National Academy of Sciences Institute of Medicine landmark report, "Reducing underage drinking : a collective responsibility," and to begin to develop recommendations for reducing underage alcohol problems in New Hampshire."

Alcohol-impaired driving is an important health and social issue as it remains a major risk to Americans' health today, surpassing deaths per year of certain cancers, HIV/AIDS, and drownings, among others, and contributing to long-term disabilities from head and spinal injuries. Progress has been made over the past decades towards reducing these trends, but that progress has been incremental and has stagnated more recently. *Getting to Zero Alcohol-Impaired Driving Fatalities* examines which interventions (programs, systems, and policies) are most promising to prevent injuries and death from alcohol-impaired driving, the barriers to action and approaches to overcome them, and which interventions need to be changed or adopted. This report makes broad-reaching recommendations that will serve as a blueprint for the nation to accelerate the progress in reducing alcohol-impaired driving fatalities.

Discusses alcohol use in the United States, including the physical effects, the origin of the drinking age, societal mixed messages, and the sociological impacts.

File Type PDF Reducing Underage Drinking A Collective Responsibility

A thorough examination of nearly everything known about the prevention and treatment of alcohol problems, this volume is directed particularly at people interested in conducting research and at agencies supporting research into the phenomenon of drinking. The book essentially is two volumes in one. The first covers progress and potential in the prevention of alcohol problems, ranging from the predispositions of the individual to the temptations posed by the environment. The second contains a history and appraisal of treatment methods and their costs, including the health consequences of alcohol abuse. A concluding section describes the funding and research policy emphases believed to be necessary for various aspects of research into prevention and treatment.

This study quantifies the social costs of gun violence in order to help policy makers determine which violence programmes to support. The authors offer detailed information about how the economic burden of gun violence is distributed in the US.
