A supercritical fluid is the phase of a material at critical temperature and critical pressure of the material. Critical temperature is the temperature at which a gas cannot become liquid as long as there is no extra pressure; and, critical pressure is the minimum amount of pressure to liquefy a gas at its critical temperature.

3.2- Basic Principles of Supercritical Fluid...

Supercritical fluids have properties between those of a gas and a liquid. A supercritical fluid can effuse through solids like a gas and dissolve materials like a liquid. All supercritical fluids are completely miscible with each other, so for a mixture a single phase can be guaranteed, if the critical point of the mixture is exceeded.

Supercritical Fluids | Introduction to Chemistry

A supercritical fluid (SCF) is any substance at a temperature and pressure above its critical point, where distinct liquid and gas phases do not exist, but below the pressure required to compress it into a solid. It can effuse through porous solids like a gas, overcoming the mass transfer limitations that slow liquid transport through such materials. SCF are much superior to gases in their ...

Supercritical fluid - Wikipedia

Supercritical fluid-based technologies for nuclear waste management have developed rapidly over the past two decades. A simple laboratory study in 1991 for testing solubility of metal chelates in supercritical fluid carbon dioxide has emerged as a new technology for nuclear waste management today.
